Q. Can you do the same procedure as above to plot the pathview figures for the top 5 down-reguled pathways?

write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quo

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

sig_genes <- res[res\$padj <= 0.05 & !is.na(res\$padj), "symbol"]</pre>

The Endosomal/Vacuolar pathway has the most significant "Entities p-value". The most significant pathways listed does have some match to the previous KEGG results. Factors that cause differences between the 2 methods is the data for each pathway that were given and what is recognized significant depending on the method.
